Food and Agriculture Organization of the United Nations

🌿 Species Master Management

To manage the central library of tree species and prevent duplicate entries in the system.

Step 1: Checking for Existing Species

Before adding a new species, always verify if it already exists to maintain data integrity.

1. **Navigate:** Go to the **Master Management** menu and select **Species Master**.
2. **Search:** Use the **"Search Species"** bar at the top of the table.
3. **Keywords:** You can search by entering either the **Scientific Name** (e.g., *Prinsepia utilis*) or the **Common/Local Name** (e.g., *Bhikal*).
4. **Review:** The list will dynamically filter as you type. Review the **Scientific Name** and **Common Name** columns to see if your species is already registered.

Step 2: Adding a New Species (only for National or State)

If your search yields no results, follow these steps to register a new species:

1. **Initiate:** Click the **"Add New Species"** button (usually located below the table).
2. **Scientific Name:** Enter the full botanical name (Genus and species). Ensure correct spelling as this is the primary identifier for reports.
3. **Common/Local Name:** Enter the name most frequently used by field officers in your region.
4. **Save:** Click the **Save** button.

Step 3: Managing the Species List (Edit)

If you find a typo or need to update a name, use the **Action** column in the table:

- ✏️ **Edit:** Click the Edit icon to modify the Scientific or Common name. Note: Changing a species name will update all existing records linked to that ID.

HARIT-SANKALP

Food and Agriculture Organization of the United Nations

Admin Justification: Why Species Standardization Matters

- **Unified Reporting:** Allows the Ministry to generate a single report showing exactly how many *Teak* or *Sal* trees are being produced across all States/UTs.
- **Error Prevention:** Prevents confusion caused by different local names for the same tree (e.g., "Neem" vs "Azadirachta").
- **Linkage:** Every QR code generated in the Seed Collection module is hard-coded to the Species ID from this master list.
