Food and Agriculture Organization of the United Nations

🌳 Nursery Migration & QR Generation

Mapping Existing Nurseries to the New Module

Objective: To link legacy nursery records to the new Revenue/Forest Directories and generate unique identification codes for system-wide visibility.

🔍 STEP 1: Identification & Filtering

Before updating, you must pull the existing records from the legacy database.

- **Regional Filter:** Select the **State** and **District**.
- **Legacy Context:** Select the **Existing Forest Division** and **Range**.

  Note: These fields refer to how the nursery was originally categorized in the old system.

🗺️ STEP 2: The Mapping Workspace

Once the list appears, navigate through the columns to "bridge" the old data to the new module.

A. Review Static Data

Verify the pre-filled information in the **Nursery & Contact Details** columns:

- **Name & Location:** Check for spelling and address accuracy.
- **Geo-Coordinates:** Ensure latitude/longitude are present (e.g., 065930, 935456).
- **Contact:** Confirm the **Forest Guard/Forester** name and phone number.

B. Update Administrative Directories (Critical Mapping)

You must map the nursery to **two distinct directories** using the dropdowns:

Directory Type	Required Dropdown Selections
🏘️ **Revenue Directory**	Sub-District → Block
🌲 **Forest Directory**	Circle → Division → Range

💡 **Pro-Tip:** If a specific Block or Beat is missing from these dropdowns, pause and add it via the **Directory Master** first.

STEP 3: Code Generation & Migration

The final step "activates" the nursery in the new system.

1. **Action:** Click the **[Generate]** button in the final column.
2. **System Result:** The system assigns a **Unique Nursery Code** and creates a **QR Code**.
3. **Synchronization:** The nursery will immediately disappear from this "Mapping" list and appear in the **Active Nursery Registration** page.
